VJ Electronix, Inc and BB Electronics A/S Announce Implementation of Advanced Scavenger Technology in Denmark

Nov 2011 — BB Electronics announces it has completed installation and integration of the new VJ Electronix 400 Scavenger system into their Horsens Denmark facility. BB Electronics, a full service EMS company, will use the non-contact solder removal system to enhance the reliability of their rework operations of highly complex circuit boards.

BB Electronics produces a wide portfolio of very complex PCBAs for world leading customers. This range from prototypes and series production of satellite communication boards, video processing and measurement systems a.o. characterized by heavy BGA population and advanced multilayer PCBs. According to BB Electronics SMT engineering supervisor Dennis Pedersen, "with the new equipment we will be able to raise the quality, speed and yield on complex rework tasks, because tough and difficult manual rework processes now are automated."

The VJ Electronix 400S is a stand-alone, Non-Contact Scavenging system for the automatic removal of residual solder from a rework site. With its automated X-Y motion, the 400S is pre-programmed to traverse the component site in the fastest and most efficient fashion resulting in the optimum heat transfer to reflow the solder while minimizing thermal exposure. Dynamic Height Sensing (DHS) ensures optimum solderability for the replacement of a new component.
